Term	Definition	Mathematical Notation	
Quantum Torus	A mathematical structure where the product of coordinates non-commutes by a fixed phase factor, representing a specific type of non-commutative geometry.	$XY = e^{2\pi i \theta} YX$	Fg
Sheaf	A mathematical tool used to systematically track local data attached to the open sets of a topological space, allowing for the transition from local to global information while identifying obstructions to gluing.	$\mathcal{H}$	AC
Monoid	A set equipped with a single binary operation that is associative and has an identity element, serving as a base for many algebraic structures.	$(M, \circ, e)$	A
12-fold fractal engine	A conceptual framework consisting of 12 persistent excitations or 'folds' in a rewriting substrate, where each fold represents a step on an algebraic ladder.	$\mathcal{F} = \{f_1, \dots, f_{12}\}$	Fg
6-question singularity	A set of six inquiries that map to recursive reaction shells, asserting	$\mathcal{Q} = \{Q_1, \dots, Q_6\}$	Fg
